Final year Project:

Post Graduation Project: Synthesis and Characterization of CuO thin film by SILAR method.

Description: The CuO films are effectively used in the energy storage devices to create a good development in the supercapacitor application. Although much work has already been done on evaporated,

sprayed and electrodeposition methods of preparation, there is little reported on modified Successive Ionic Layer Adsorption and Reaction (SILAR) method.

In the present work, an attempt to prepare CuO thin films by the SILAR method. This method is well suited for the preparation of CuO thin films, because of its easy of synthesis, low cost, safe and high growth rates. The film characterization will be carried out using X-ray diffraction (XRD), Scanning electron microscopy (SEM), and Water contact angle. The structural analysis will be studied using XRD. Surface morphology of the thin film will be studied using SEM. In order to study surface properties such as hydrophilicity or hydrophobicity the contact angle measurement is carried out.
